Microflush Half Gallon Toilets

Marine Heads
Air Operated

Model LF-210

Model LF-219

Model LF-310

Model LF-320

Installation/Service Manual
P/N 24533
THANK YOU FOR PURCHASING A MICROPHOR® PRODUCT!
Your Microflush™ Marine Head is designed to provide you with years of reliable service while using only two quarts of salt or fresh water per flush. Please read this Owner's Manual completely prior to installation of your Microflush Marine Head. This will familiarize you with all of the proper installation and operation requirements.

CUSTOMER SERVICE - Please contact your local Microphor dealer for parts and service. For a list of dealers, please contact Microphor at the addresses listed on the cover of this manual.

AIR SYSTEM
Filter-regulators are available in a variety of sizes and types. Their purpose is to remove water, oil and other foreign matter from the air line and to maintain a constant pressure at the toilet of 60-65 PSI. The following steps must be observed to assure moisture will be removed from the airline:
1. Drain air compressor receiver regularly. Most water tends to accumulate at this point.
2. Install drip legs with condensate drains at all low points in air piping.
3. Whenever possible, grade all airlines back to the air receiver or drip leg assembly and drain regularly.
4. The air supply to your Microflush Marine Head must be taken from the top of the main or branch air line.

AIR COMPRESSOR
Be certain compressor crankcase has proper oil levels. Locate the compressor in a clean, dry, well ventilated location. Size compressor according to separate Air Compressor Specifications Sheet.

1 PRE-INSTALLATION
Following procedures apply to all Microflush models unless otherwise noted. Remove your Marine Head from box carefully. Integral Models - Install toilet seat and flush handle before mounting Microflush to floor. Seat is not included with LF-210 and LF-219 models. Bolt caps and closet screws are provided with LF-210 and LF-219 models.
2 AIR LINES
All piping supplied by customer is to conform to U.S.C.G. requirements relating to water tight decks and bulkhead (46CFR56.69)

Be sure airline from compressor is of sufficient size, based on length of pipe run to head. We suggest 3/8” air line up to 40’, 1/2” air line up to 75’, and 3/4” air line for over 75’.

Install a filter-regulator assembly in incoming airline. Place the filter-regulator as close as possible to the first Microflush Marine Head and in an accessible location.

Set filter-regulator so that 60-65 psi constant is available at the head. Install an in-line air dryer, Microphor P/N 30054 or combination filter/regulator/dryer, P/N 94036.

Assemble the Air Connecting Kit provided and connect to incoming air line with shut-off valve between bulkhead and toilet. For LF-210 Models, use Air Connecting Kit P/N 93086, and for LF-219 Integral Models use Air Connecting Kit P/N 95172. The plastic airline provided goes from the air supply to the Flush Activator. On integral models, the plastic air line enters the Microflush through the back wall or up through the floor under the unit. Make sure air is OFF at air compressor.

DO NOT CONNECT TO FLUSH ACTIVATOR YET!

3 WATER LINES
Use a 1/2” water line and install a water shut-off valve (angle stop) between bulkhead and toilet. Water at the head must be regulated at an even pressure between 20 to 50 PSI for Microflush to operate properly. Optimum pressure is 35 PSI.

DO NOT CONNECT WATER LINE TO MICROFLUSH YET.

4 DRAIN CONNECTION - See Rough-in Dimensions
For direct overboard discharge, contact Microphor or your dealer.

When using a 1-1/2” (38.1 mm) discharge line, each toilet must go individually to the MSD or holding tank. Do not connect more than one toilet to a 1-1/2” (38.1 mm) discharge line.

If a vertical rise is required, the vertical rise must be at the toilet. The maximum vertical rise is 36”. The maximum horizontal run is 30 feet (9.14 meters) and must slope a minimum of 1/8” per foot (1 in 100) towards the MSD or holding tank. For 1-1/2” lines, reduce horizontal pipe run 2 feet (.68 meters) per 90° elbow. Use long sweep elbows, do not use 45° elbows. Do not use the inverted P-Trap with a vertical rise.

When multiple heads are installed, a vented 3” gravity collection line is to be used with not more than 4 heads per 3” line. Manifold the 1-1/2” lines into the 3”collection line and provide a grade of at least 1/4” per foot towards the MSD or holding tank. Vent 3” line at the manifold point.

Holding tank or MSD must be vertically vented to atmosphere via 3” vent, terminating at highest point possible. Limit the number of 45° or 90° fittings. Do not install loops on end of vent.

For holding tank installations, consider installing a power fan sized so that a volume of air equal to the empty tank volume is exchanged every 30 to 60 seconds. The negative pressure shall not exceed -1.3 psi. This will allow for good air flow out the vent.

Your Microflush Marine Head discharge line must have a rise (trap) in order to provide back pressure during the flush cycle - see Rough-in Dimensions on pages 14-15.

Caution: Do not apply stress to align Microflush rear or downward discharge outlet to waste line. This will result in eventual damage to seal between Hopper and Toilet Bowl, causing leaking. Do not use the P-Trap with a vertical rising waste line.

LF-210 Downward Discharge Model: Rest Microflush on it's back on a padded surface (e.g.
Center wax ring over Hopper Flange. Turn Microflush Marine Head over, lift up, and center it with the horn of the wax ring into standard floor flange located on centerline 12" from wall. Compress the wax ring by applying weight to your Microflush Marine Head. A second standard wax ring may be added if floor is uneven. If Hopper Flange hits floor flange, grind it down for added clearance, as any contact will break seal between Hopper and Toilet Bowl, causing leaking.

**All Rear Discharge Models:** Install inverted P-Trap supplied with Microflush Marine Head. Do not glue or connect fittings until fitting alignment has been checked.

**Caution:** Outlet of LF-210 and LF-219 Models is 3/4" off centerline. Make sure head discharge and waste line are in line, not off set.

When using a 1-1/2" discharge line, a vertical lift of 36 inches can be achieved in single head applications. The vertical rise must be at the toilet. This vertical application is not advised for commercial, high use applications. Do not use the P-Trap with a vertical rising waste line. Please contact the factory for further information.

**LF-219 Model:** For downward discharge, use molded P-Trap hose supplied. For rear discharge use inverted P-Trap. See page 9 for part numbers.

**Remote Models:** Position and mount the Remote Valve Assembly making sure the Vacuum Breaker is at least 6" above the rim of the Microflush Marine Head bowl. Measure air and water lines to make sure Remote Valve is mounted within connection distance to Microflush Marine Head. Run water and the three air lines from the Remote Valve Assembly to Microflush.

**Caution:** For Remote Flush Activators, make sure inside wall thickness does not exceed 1/2" or large mounting nut will restrict movement of flush handle.

Mount toilet bowl to floor. LF-210 and LF-219 models mount to floor with 1/4" closet bolts provided. Screw on bolt caps to mounting screws. Model LF-310 and LF-320 models are bolted to floor, bolts not provided.

**LF-320 Models:**
1. Remove side panels to facilitate mounting toilet.
2. Connect 7' water line to Spud fitting at the back of the toilet bowl.
3. Run water and the three air lines from the Microflush through wall access (maximum 7 feet).
4. Position toilet and connect hopper discharge outlet to waste line.
5. Bolt toilet to floor and attach back plate to wall. Do not reposition toilet after it is connected to the waste line as this may break the seal between bowl and Hopper and cause a water leak. Re-install side panels on toilet.
6. Connect the three air supply lines to the Air/Water Sequence Valve, color coded lines to matching color coded fittings.
7. Mount Remote Valve Assembly at least 6" above the rim of the bowl, and mount the Flush Activator assemblies at desired location on wall.

**5 WATER CONNECTION**
Never install a check valve on the inlet side of the Microflush head.

**Integral Models** - Connect incoming water from angle stop to water connector. Make sure WATER IS OFF at angle stop.

LF-210 Models - water supply connector is made of nylon-plastic. Be careful not to cross threads. LF-219 Models - if integral model is connected to a potable water source, the unit requires installer to provide a Back Flow/Cross Contamination Prevention device. Please check applicable jurisdiction for requirements before installation.

**Remote Models** - Connect incoming water from angle stop to Microflush Hose Barb on the Remote Valve Assembly. Connect the water line from Remote Valve Assembly to the Flush Rim Spud Assembly. Connect the water line from Remote Valve Assembly to the Flush Rim Spud Assembly. Make sure WATER IS OFF at angle stop.
START UP
1 Turn air ON at compressor.
2 Turn air ON at air shut-off cock (near but not connected to Flush Activator) to blow out airlines for a few seconds. This procedure should remove any debris or contaminants from the airline. Turn air OFF at shut-off valve.
3 Connect airline to Flush Activator. Make sure air shut-off valve is installed next to Flush Activator. Do not over-tighten fittings.
4 Turn ON air shut-off cock. Check total installation for air leaks using soapy water.
5 Turn ON water. Check for water leaks.
6 Flush your Microflush Marine Head four times, waiting twenty seconds between flushes to get water through the system and operating regularly. To flush properly, hold down Flush Activator Handle or Button until flapper opens.

DOUBLE CHECK
1 Air pressure at Microflush Head is at 60-65 psi.
2 Water Pressure at Microflush Head is between 20-50 psi, 35 psi optimal.
3 Water level in bowl should be at top edge of flapper opening. If your Microflush does not operate correctly, refer to troubleshooting sections.

CLEANING BLEED-OFF PLUG ASSEMBLY
Standard Flush:
Remove plug and clean with solvent; air blow dry.

Positive Flush:
Remove plug and clean with solvent; air blow dry; remove and clean plug on Detent Valve.

Note: Use 5/32" or 4mm Allen wrench to remove plugs.

Note:
Bleed-Off Plugs on Air & Water Sequence Valves and Detent Valves are different sizes that are not interchangeable.

FLUSH CYCLE ACTIVATORS
There are two types of Flush Activators:

Standard - hold handle or button down for 1 second.
Positive - barely push handle or button to activate.

Maintenance/Cleaning/Clearing/Winterizing

Routine Maintenance
Your Microflush Marine Head has an air-operated Air/Water Sequence Valve which requires periodic lubrication with a silicone based lubricant. Check your application at right to determine how often to lubricate your Air/Water Sequence Valve. The Air Cylinder should be serviced if you have to take up your Microflush Marine Head for any reason. The air system must be free of moisture. Drain air receiver regularly to remove moisture.

CLEANING
Use Micro-Clean Organic Spray Cleaner, P/N 24542. Sanitizers like Lysol, Pine-Sol, Hexol, ammonia base products, caustic drain openers or non-biodegradable cleaners should never be used if the plumbing system is connected to a Microphor MSD.

1. While depressing the Flush Activator, turn OFF the water. Allow the bowl cleaner to flow into the lower chamber. Keep the Flushing Activator depressed.
2. Insert bowl brush into lower chamber and agitate mixture carefully. Remove the bowl brush and release the flush activator.
3. Turn the water ON and flush twice to rinse thoroughly.

NOTE: LF-310 or LF-320 Stainless Heads may be subject to surface rusting, especially if salt water is used for flushing and if bleach or a corrosive product or cleaner is left standing in or on the bowl. The salt water will enhance the oxidation qualities of the bleach (or product containing bleach). If it sits on the stainless and the surface remains damp, the chrome and nickel will etch out of the stainless, leaving ferrite iron, which will rust. If bleach or any cleaner is used, it must be well rinsed, not left standing (soaking) in the bowl or on the toilet, especially in toilets using salt water.

CLEARING YOUR MICROFLUSH HEAD
If your Microflush Marine Head becomes plugged, shut off the water supply, press the flush handle and hold. The flapper will remain open until flush handle is released. Check to see if the restriction can be removed from lower portion of Microflush Marine Head with a hooked wire, being careful not to damage the rubber seal on the flapper or the mating surface on the hopper. If obstruction cannot be picked out with a hook or tongs, use plunger by pushing in slowly and pulling out quickly to pull object back into the hopper. If necessary, turn air off and use a snake inserted through a short plastic pipe placed in hopper. Pipe will protect flapper seal. If valve will not operate with water off, hold flush lever down and turn water on and off quickly to free valve action. When the passage becomes clear, turn on water and press flush handle to start flush cycle.

WINTERIZING (out-of-service winter storage)
Shut OFF water to Microflush Marine Head. Flush Microflush Marine Head three times or until water no longer flows into the bowl. Unhook water supply at angle stop. Empty water in line into receptacle. Shut OFF air supply to your Microflush Marine Head. The unit is now prepared for freezing temperatures. OPEN petcocks on drip legs and air receiver drain after shutting down air compressor and isolating airlines. Use of Anti-freeze is not recommended.

PATENTS
Microflush® Toilets are covered by one or more of the following U.S. patents: 5245710; 4918764; 1280554; 169471 and related foreign patents.

WARNINGS
Do not use any petroleum based lubricants (Vaseline) on any rubber parts or o-rings as damage will occur. Use only silicone based lubricants.
Do not use any ‘Locktite’ brand adhesives on any plastic or Delrin components as fumes will cause damage.
Do not use Teflon tape on any air fittings as clogging may occur.

DESIGN CHANGES
Continuing a policy of research and development, Microphor reserves the right of price, product or design change without notice or obligation.
TROUBLESHOOTING

Your Microflush® toilet is designed to give you years of trouble-free operation. Please check the following before beginning any service or repair:

Water supply: 1 Is the water turned on?
2 Is the water pressure between 20 and 50 psi at the toilet for pressure water system?
3 Is there 6 feet minimum of head for gravity systems?
Fluctuating or high water pressure can cause intermittent problems with the toilet operation. Check the water pressure at different times of the day (i.e., early morning, noon, evening) to determine if you have fluctuating or high water pressure. A pressure-reducing valve installed on the incoming water line will assure you have even pressure. Make sure no check valve is installed before the Air/Water Sequence Valve.

Air system: 1 Is the air turned on?
2 Is the air pressure set at a constant 60-65 psi at the toilet?
3 Do you have any air leaks or kinks in the air system?
4 Do you have water in the air system? This usually causes irregular timing.
Drain the compressor tank and check the filter regulator and drip leg(s) for water. To check for water in Air/Water Seq. Valve, remove Bleed-Off Plug, put finger over screw opening and flush. If water is present, it will squirt out. If water is detected, then the air cylinder and airlines must also be drained.

Cycle time: 1 Is the flapper cycle time set correctly at 4-8 seconds?
2 Is the bleed off assembly plug blocked? Remove, clean and reinstall (see page 5).

HOPPER REPLACEMENT

Model LF-210 and LF-219 Models Only

CAUTION: Read this entire procedure before beginning work!

1. Remove toilet from floor. Place toilet upside down on a sheet of cardboard or other padded material.
2. Remove nuts from J-bolts on either side of hopper, lift hopper from bowl.
3. Remove o-ring between hopper and seal adaptor. Check that o-ring is not damaged, replace if necessary.
4. Re-assemble in reverse order. MAKE SURE J-BOLTS ARE TIGHT! Proper torque specification is 4-6 inch/lbs.

Note: The air cylinder on the hopper sub-assembly should be cleaned, lubricated and checked for adjustment whenever the toilet assembly is removed for servicing.

TANK ISOLATION VALVE INSTALLATION (Not supplied with toilet.)

Note: Check valve halves for tightness before installing.

Rear Discharge with LF-219 Downward Hose
Install Tank Isolation Valve Assembly in line at the end of the discharge hose using a 1-1/2" long pipe nipple.

Rear Discharge
Glue tank isolation valve assembly to hopper at point indicated.

Bottom Discharge, No Flange
Glue Tank Isolation Valve Assembly directly to hopper discharge as indicated.

Bottom Discharge with Flange (1-1/2" pipe)
Glue 1/2" long pipe nipple to hopper discharge port as indicated, and glue Tank Isolation Valve assembly to pipe nipple.

NOTE: Isolation Valve is in two pieces; tighten valve before installation and again before making drain connection!
AIR CYLINDER ADJUSTMENT
1. Remove Hopper (see Hopper Replacement).
2. Remove the clevis pin retaining ring. Remove the clevis pin.
3. Inspect the crank arm, clevis and clevis pin for wear. Replace if required.
4. Hold the crank arm in the UP position (flapper closed).
5. Fully extend the air cylinder and note the position of the holes in the crank arm and the clevis. The clevis hole should extend half its diameter past the crank arm hole.
6. Adjust as necessary by loosening the locknut and extend or retract the clevis as required.
7. Re-install Hopper.

TO CHANGE FLAPPER GASKET:
1. Turn water and air off.
2. Reach behind flapper to grasp gasket tails.
3. Pull tails out of slots to remove old gasket.
4. Installation is the reverse of removal.
5. Tails must be pulled all the way through to insure smooth surface.

AIR/WATER SEQUENCE VALVE COMPONENTS
Components shown in *italics* are part of Kit, P/N 95057.

Spacers and Spool available as a set, P/N 95530.

Water Body, Main Body and Bottom Cap available as a set, P/N 39386.

---

26856 - O-Ring Lubricant
39386 - WaterBody/Main Body/Bottom Cap Assy
95057 Kit Components shown in *Italics*
AIR/WATER SEQUENCE VALVE OPERATION

1. In the normal rest position, pressurized air enters the Flush Activator and goes from Flush Activator Port 1 (Green tube) to Air/Water Sequence Valve Port 2, through Port 3 (Red tube) to Air Cylinder Port 4 holding the Flapper closed, sealing the water in the bowl and maintaining a proper water surface area.

2. When the Flush Activator is pressed, air is shifted to Port 5 (Blue Tube) to A/W-Seq. Valve Port 6 and on to Air Cylinder Port 8 (White Tube). The air in the base of the Air Cylinder is bled off through Port 4 (Red Tube) to Port 3 and out Vent [1], allowing the Air Cylinder to retract, opening the Flapper. Simultaneously, pressurized air in the base of the A/W-Seq. Valve pushes the piston and spool assembly up to open the water passage, allowing water to enter and rinse the bowl. The air on the top of the piston is bled off through Port 1 and out Vent [2].

3. As the Flush Lever is released, the Flush Activator returns to the normal rest position redirecting pressurized air to Port 2, Port 3 and Port 4. The Bleed-Off Plug [12] bleeds off the air (Black Tube) under the piston, causing the spool to move downward, gradually closing the water passageway. The air having been bled off the top of the Air Cylinder Port 8 (White Tube) through the end of the Flush Activator Vent [2] (Blue Tube), allows the Air Cylinder to close the Flapper allowing water to accumulate in the bowl, restoring a proper water surface area.

4. Near the bottom of the piston stroke, the air passageway from Port 10 (Yellow Tube) to the Hopper Port 11 is unblocked for 4-11 seconds to pressurize the hopper and expel the waste contents over the trap and into the waste line.

5. As the A/W-Seq. Spool reaches the bottom position, the water supply is shut off, completing the flush cycle.

In the event of air supply failure, the spring in the Air/Water Sequence Valve maintains the valve in the closed position, blocking the water passageway. The Flapper will open and allow water in the bowl to flow into the hopper forming a water seal.

Grpc: AWS-bw
ROUGH-IN DIMENSIONS: LF-210, LF-310 and LF-320 Models.  NOTE: All dimensions may vary ½"±

**LF-210 Round - Downward Discharge**

AIR HOOK-UP 1/4" COPPER TUBING COMPRESSION FITTING TO AIR SUPPLY

18.75"  15"  3.75"  12"  9.25"

WATER HOOK-UP 1/2" STRAIGHT PIPE THREAD

16.43"  15.5"  7.75"

CUTOUT AT REAR

TOILET DISCHARGE 1-1/2" PIPE SIZE (IPS) TO ACCOMODATE FLOOR FLANGE

13"  24.5"  8.69"

MOUNTING HOLES (4)

ROUGH-IN DIMENSIONS: LF-219 Models

NOTE: All dimensions may vary

**LF-210 Rear Discharge**

TOILET DISCHARGE 1-1/2" SLIP/HUB PIPE SIZE (IPS)

1.12"  2.19"  8.5"  15.5"

**LF-310 Rear Discharge**

Water Hook-Up 1/2" FNPT

21"  19"  3.5"  8.5"  4.25"  10.25"

Air Hook-up 1/4 " Copper Tubing Compression Fitting To Air Supply

**LF-320 Rear Discharge**

Air and Water Connection From Remote Flush Assy, Are Inside Toilet Shroud

13.25"  19"  3.5"  4.25"  6.88"

Toilet Discharge 1-1/2" Slip/Hub
